iCone *mini* and *iCone classic*

(ISO 5660; ASTM E1354)

The *i*-series of Cone Calorimeters
Following a successful launch of the iCone Calorimeter in 2013, the release of two new models called the iCone mini and iCone classic, marks the beginning of a second generation of the iCone series, offering semi-automated control and a further enhanced fire model.

The iCone series is now completed by two semi-automatic models – the iCone mini which features a separate gas analysis rack and the iCone classic which has a fixed gas analysis console mounted on the instrument main frame. These have replaced the FTT Dual Cone and Standard Cone respectively. The iCone has undergone further modification on its fire model and glass protective screen and is now called iCone plus.

The iCone series brings calorimetry to a new level of automation and make it available at different budget levels.

**Cone Calorimeter**

The name “Cone Calorimeter” was derived from the shape of the truncated conical heater that Dr. Vytenis Babrauskas used to irradiate the test specimen (100mm × 100mm) at fluxes up to 75-100kW/m² in the bench-scale oxygen consumption calorimeter that he and his co-workers developed at NIST. The Cone Calorimeter is now the most significant bench-scale instrument used in the field of fire testing because it measures important real properties of the material being tested under a variety of preset fire conditions. These measurements can either be used directly by researchers, or they can be used as input data for correlation or mathematical models for predicting fire development.

Directly measured properties include:
- Heat release rate
- Time to ignition
- Mass loss rate
- Smoke release rate
- Effective heat of combustion
- Rates of release of combustion gas (e.g. carbon oxides)

**Oxygen Consumption Principle and Heat Release Rate**

The heat release rate is the single most important parameter that can be used to characterise fire. It provides a measurement of the size of the fire, and the rate of fire growth, and allows calculation of the time available for escape or suppression. Most fire parameters are directly proportional to the size of the fire so by knowing the heat release we also have a good indicator of the level of smoke and other combustion products being generated.

Huggett and Parker examined in detail Thornton’s assumption that constant quantity of heat was released per unit of oxygen consumed using a variety of fuels,
and assessed its effect on the accuracy of heat release measurement based on it. He concluded:

1. The heat release rate in a fire can be estimated with good accuracy from two simple measurements, the flow of air through an exhaust and the concentration of oxygen in the exhaust.
2. The heat release from a fire involving conventional organic fuels is $13.1 \text{kJ}$ per gram of oxygen consumed, with an accuracy of $\pm 5\%$ or better.
3. Incomplete combustion and variation in fuel have only a minor effect on this result. Appropriate corrections can be made if necessary.
4. The oxygen consumption technique for heat release measurement is adaptable to a wide range of applications ranging from small-scale laboratory experiments to very large-scale fire system tests. A number of heat release apparatuses have been developed since and based on these findings. The most important of these is the ‘Cone Calorimeter’.

**Oxygen Consumption Calorimetry**

$$q = (13.1 \times 10^4) \frac{C \Delta P}{T_e} \left( \frac{X_{O_2} - X_0}{1.105 - 1.5 X_{O_2}} \right)$$

Where:

- $q$ = Rate of heat release (kW)
- $C$ = Orifice plate coefficient ($\text{kg}^{1/2} \cdot \text{m}^{1/2} \cdot \text{K}^{1/2}$)
- $\Delta P$ = Pressure drop across the orifice plate (Pa)
- $T_e$ = Gas temperature at the orifice plate (K)
- $X_{O_2}$ = Measure mole fraction of $O_2$ in the exhaust air (no units)
- $X_0$ = Initial mole fraction of $O_2$ in the exhaust air (no units)
Modelling with Calorimeter Data
Early work carried out in the USA and Sweden showed how successful the Cone Calorimeter was in generating good input data for models.

After the EUREFIC project demonstrated excellent prediction of Room Corner test (ISO 9705) performance for wall lining materials from Cone Calorimeter data the European Commission funded several large multi-lab research projects to develop models for prediction of the performance of finished construction products from small scale calorimeter tests. These include the CBUF (Combustion Behaviour of Upholstered Furniture Project) for Furniture, and FIPEC (Fire Performance of Electric Cables) for electric cables.

FTT’s Contribution to the Development of Calorimetry
In the mid 1980s FTT directors worked with Babrauskas and other colleagues to help develop international test standards based upon oxygen consumption calorimetry.

They also designed European prototypes and Stanton Redcroft’s commercial Cone Calorimeter.

FTT has been the world’s leading manufacturer of all calorimeters, including full scale calorimeters (e.g. Furniture Calorimeter, the ISO 9705 Room Corner test and the SBI) since 1989. Throughout this period FTT scientists and engineers have worked on several calorimetry research projects and contributed extensively to International, European, ASTM and British Standardisation groups.

International standards have been published describing the equipment and several national standardisation bodies have also published product standards for use of the Cone Calorimeter in assessing performances of finished products as listed below:

- Furniture (ASTM E1474)
- Wall lining materials (ASTM E1740)
- Prison mattresses (ASTM F1550)
- Electric cables (ASTM D6113)
- Railway rolling stock applications (EN 45545-2)
- Maritime applications (IMO)

FTT has supplied more than 400 Cone Calorimeters to customers in more than 40 countries for both research studies and testing in accordance with fire safety standards. FTT’s specialist calorimetry design engineers ensure their products integrate new developments FTT’s production engineers are the world’s most experienced Cone Calorimeter builders and its team of specialist service engineers ensure that FTT calorimeters are promptly maintained on all 5 continents.
**iCone Calorimeter Series**

FTT provides customers with automated instruments that utilise state-of-the-art technology to improve the efficiency and accuracy of the fire test process. The FTT iCone Calorimeters have been developed as an industry-leading third generation of Cone Calorimeter.

They feature an interactive and intuitive interface, sophisticated and flexible control options, and built-in data acquisition technology for robust data collection, analysis and reporting. They incorporate many new features not previously seen by fire testing laboratories while being compact, accurate, reliable and easily maintained.

FTT’s iCone plus is the only fully automatic Cone Calorimeter in the world and the most advanced model in our new range of Cone Calorimeters designed using decades of FTT’s experience in calorimetry. The other two models in the iCone range are the iCone mini and iCone classic which have replaced the FTT Dual Cone and FTT Standard Cone respectively. These three iCone models differ in the level of automation, requirements to meet the various needs for fire science research and testing laboratories.

For applications and tests where users would like to be more involved in the operation and running of the tests, and/or for smaller budget, iCone mini and iCone classic are the best solutions.

A full system of the iCone mini and iCone classic consist of:

**Conical Heater**
- 5kW electrical heating element wound in the form of a truncated cone, rated 5000W at 230V with a heat output up to 75-100kW/m²
- Motorised specimen height adjustment during test to accommodate materials that intumesce or shrink
- Facility for testing horizontally or vertically orientated specimens

**Temperature Controller**
- Temperature of the conical heater is controlled using 3 type-K thermocouples and a 3-term (PID) temperature controller
- Testing at varying heat fluxes to a present heat flux profile (of up to 10 steps or changes between 10kW/m² up to 75-100kW/m²), can be set using the ConeCalc software

**Motorised Heat Shield**
- Automatic/Manual controlled split shutter mechanism to protect specimen from heat exposure before test
- Ensures the initial mass measurement is stable and the operator has ample of time for system checks before starting the test. This facility is essential for easily-ignitable samples, which often ignite prematurely if a shutter mechanism is not used

**Specimen Holders**
- Made of stainless steel
- For specimens 100mm × 100mm up to 50mm thick

**Specimen Spacers**
- A set of 6 different specimen spacers are provided for easy and precise adjustment

**Load Cell**
- Mass measurements are taken using a strain gauge load cell with a sensitivity better than 0.01g
- Mounted on an independent table to avoid any vibration from exhaust fan
Smoke Obscuration
- Measured with a laser system, using Silicon photodiodes, and a 0.5mW Helium-Neon laser, with main and reference (compensating) photo detectors
- Supplied with alignment cradle and 0.3, 0.8 neutral density filters for calibration
- For setting the irradiance level at the surface of the specimens
- The heat flux is automatically set using the ConeCalc software, heat flux meter and temperature controller

Exhaust System
- Manufactured from stainless steel for long life
- Comprising stainless steel hood and ducts, gas sampling ring probe, exhaust fan (with adjustable flow controls) and an orifice plate flow measurement thermocouple and differential pressure transducer
- Normal operation is at a nominal 24L ℓ/s (range 0-50 ℓ/s)

Gas Sampling
- Comprising of soot filters, pump, moisture removal traps (CO₂ removal traps if not measured)

Combustion Gas Analysis
- Paramagnetic oxygen analyser with a range of 0-25% O₂ and a performance compliant with the standards
- Non-dispersive infrared detectors with a range of 0-10% CO₂ and 0-1% CO (option)
- Developed specifically for FTT calorimeters. This analyser features low drift, low noise and fast response

Calibration Burner
- For calibrating the heat release rate measured by the apparatus using methane of 99.5% purity.

Data Acquisition
- Data Acquisition/Switch Unit featuring a 3-slot cardcage with up to 6½ digit (22 bit) internal DMM enabling up to 120 single-ended or 48 double-ended measurements. Scan rates up to 250 channels/s are available with a USB and Ethernet interface as standard. All readings can be automatically time stamped and can be stored in a non-volatile 50,000-reading memory.
ConeCalc Software

- User-friendly Windows based ConeCalc user interface with push-button actions and data entry fields and capable of:
  - Instrument control and showing status of the instrument
  - Calibration of gas analysis instrumentation and storage of calibration results
  - C-factor calibration with the use of mass flow controller
  - C-factor calibration via pool fire (ethanol) routine
  - Collecting data generated during a test
  - Calculating the required parameters
  - Averaging of multiple tests
  - Presenting the results in a manner in accordance with ISO 5660-1 and ASTM E1354
  - Exporting calculated data to CSV (comma separated variable) files for quick transfer to spreadsheets

Test Parameters

- Heat flux (kW/m²)
- Flow rate in exhaust duct (l/s)
- C-factor \((m^{1/2} \cdot kg^{1/2} \cdot K^{1/2})\)
- Ignition time and extinction time (s)
- Heat release rate (kW/m²)
- Smoke production rate (m³/s)
- Mass loss, Mass loss rate (g, g/s)
- Effective heat of combustion (MJ/kg)
- Specific extinction area (m²/kg)
- CO₂ yield (kg/kg)
- CO yield (kg/kg)
- Total heat release (MJ/m²)
- MARHE (kW/m²) [Maximum average rate of heat evolved]
- Total oxygen consumption (g)

Fire model and specimen inside glass protective screen

17” touchscreen PC and ConeCalc software
Unique Features of FTT’s iCone mini and iCone classic Calorimeters

- Remote cone assembly positioning control, so that heater-specimen surface separation can be adjusted pre- and mid-test, to facilitate testing of intumescent or thermally distorting specimens
- Programmable heat flux exposure. Up to 10 consecutive heat flux ramping or holding can be programmed
- Motorised heat shield to protect specimen from heat exposure before test
- Motorised positioning and control of spark igniter to ignite the combustion gases from the specimen
- Hinged heat resistant glass protective screen which provides a draft-free environment around the fire model with clear viewing and easy access
- Semi-automatic/manual calibration by ConeCalc Software
- Load cell resolution of 0.01g and load capacity up to 8.2kg (Sartorius cell)
- Load cell mounted on an independent table to avoid any vibration from exhaust fan
- Fire model protection alarm system
- Online support and remote control of instruments from FTT for internet connected system
- Optional larger Cone fire model for testing specimens with very low heat release rates. 150mm × 150mm specimens are exposed to uniform heat flux over entire surface
- Optional fully integrated FTIR gas analysis system supplied with heated sampling module, heated lines/probes and PLC controller
Flexibility with FTT Calorimeters

All modern heat release measurements use oxygen consumption calorimetry. The analysis and instrumentation used for quantitative oxygen, carbon monoxide and carbon dioxide measurements in both large and small calorimetry have similar specifications. Thus a single set of instrumentation can be used for many test apparatus.

The *iCone* mini Gas Analysis Rack can be used both for *iCone* and Large Scale Calorimeters which require higher capacity pumps and gas handling filtration [e.g. ISO 9705 Room Corner test, Furniture Calorimeters, Cable Fire Testing Rigs (EN 50399), SBI Apparatus (EN 13823)].

When used with the Cone Calorimeter, the gas analysis rack is completely housed within the *iCone* mini unit.

When required for the Large Scale Calorimeter this analysis rack is quickly decoupled from the *iCone* main frame and transferred, on the factory-fitted castors, to the new location for equally quick connection to power, signal and sampling lines of the larger calorimeter.

**FTT** calorimeters are designed to have interchangeable modules that give the user maximum operational or upgrade flexibility. Almost all ducted rigs like the IEC 60332-3 can be readily converted to large calorimeters by use of the analysis rack from the *iCone* and an instrumented duct insert which **FTT** provides. The latter houses all necessary gas sampling, temperature and duct flow rate probes.

**Options**

The flexibility and versatility of the *iCone* Calorimeters are further enhanced by the availability of a range of components and test modules from **FTT**.

- Integrated 17” Touchscreen and 1u keyboard with touchpad and drawer
- Integrated Computer system
- Integrated Carbon Dioxide and Carbon Monoxide – NDIR gas analysers
- Sartorius Load Cell (increased range)
- Soot Mass Sampling
- Large Cone Fire Model (ISO/TS 5660-4, ASTM E2965) – for testing samples 150mm × 150mm and gives uniform heat flux over entire sample surface
Controlled Atmosphere Attachment – for testing specimens in low oxygen atmospheres (0-21%) that may be found in well developed fires, or for studying the effects of gaseous suppressants or other dynamic controlled-atmosphere environments. The cone assembly is located on top of the enclosure with exhaust gas exiting through the cone only. The cabinet replaces the conventional cone assembly but uses the same controllers as the normal cone. There is a door on the front of the assembly with a viewing window.

Changing between the standard fire model and this unit is simple. The Cone Calorimeter is fitted with a gas mixing attachment to mix air and nitrogen which can be supplied at flows between 0-200 l/min to the chamber. The gas supply lines are fitted with flow meters and flowstat flow controllers and a mixing chamber. These are external to the enclosure chamber and housed in a mobile control unit.

FTIR – the FTT FTIR is an advanced gas analyser used for continuous measurement of combustion gases in conjunction with FTT’s Cone Calorimeter, Smoke Density Chamber or SBI. The analysis of gases in fire effluents is very complex and challenging due to the great number of different organic and inorganic chemicals which these atmospheres can contain. FTT’s FTIR is fully configurable to meet the requirements of several international standards including ISO 19702, ISO 9705 and EN 455452. It is capable for individual analysis of airborne concentrations of CO, CO₂, NO, NO₂, SO₂, HCl, HF, Phenol, Acrolein, water vapour, etc. The FTT FTIR is a modular construction comprising of FTIR gas analyser, heated sampling unit and a touchscreen PC which are mounted in a 19" rack.

Cone Corrosimeter – built in accordance with ASTM D5485 and used for assessing the corrosive potential of combustion products.

TECHNICAL SPECIFICATIONS

17” PC (integrated in Gas Analysis Rack)

User-friendly Windows based ConeCalc 6 software user interface with push-button actions and data entry fields and capable of:

- Instrument control and showing status of the instrument.
- Software and hardware supports all major types of Cone Calorimeters.
- Configuration settings and transducer calibration details can be fully modified in the software.
- Easy to use calibration routines for gas analysers, mass flow meters, smoke system and load cell.
- Full access to all calibration details.
- C-factor calibration with the use of mass flow controller (option).
- C-factor calibration via pool fire (ethanol) routine.
- C-factors are recorded and can be viewed in the software.
- Ambient pressure compensation either through software or built into oxygen analyser.
- The signals from each transducer connected to the data logger system can be viewed in both engineering units and raw voltages.
- The cone heater temperature for each combination of heat flux, separation and orientation is stored.
- A temperature profile during the test, consisting of up to 10 steps, can be set.
- Optional pre-test calibrations automatically set oxygen reading to 20.95%, mass flow meters to zero and balances photodiodes on laser system.
- Full edit of data after test.
- All test information is stored in one file and all data is stored as recorded no corrections are made to the raw data.
- Report can be printed and previewed from within the ConeCalc application.
- Reports can include data from multiple tests. Several average scalar values are calculated and the data from each test run can be printed on each graph.
- Reports can be printed in colour.
- All reduction parameters can be edited and the data rereduced without affecting the original data.
- Full support for maximising the functionality of the CO/CO₂ analyser (so that the heat release rate can be calculated including the carbon oxide data).
- Data can be reduced using a number of different criteria.
- Includes drift and noise calculation routine for both the oxygen analyser and smoke system as described in the ISO 5660 standards.
- Presenting the results in a manner in accordance by ASTM E1354, ISO 5660-1 & 2 and EN 45545-2.

Test Parameters

- Heat flux (kW/m²)
- Flow rate in exhaust duct (ℓ/s)
- C-factor (m^{1/3}·kg^{1/2}·K^{1/2})
- Ignition time and extinction time (s)
- Heat release rate (kW/m²)
- Smoke production rate (m²/s)
- Mass loss, Mass loss rate (g, g/s)
- Effective heat of combustion (MJ/kg)
- Specific extinction area (m²/kg)
- CO₂ yield (kg/kg)
- CO yield (kg/kg)
- Total heat release (MJ/m²)
- MARHE (kW/m²) [Maximum average rate of heat evolved]
- Total oxygen consumption (g)

Due to the continuous development policy of FTT technical changes could be made without prior notice.

SERVICE REQUIREMENTS

Electric  
230VAC, 28A, 50/60 Hz. Single phase for the iCone  
230VAC, 8A, 50/60 Hz. Single phase for the gas analysis rack

Water  
250kPa (35 psi)

Exhaust Extraction  
250-500 ℓ/s

Standard Gases  
Oxygen-free nitrogen, methane (UHP 99.5%)

Optional  
CO 0.85%, CO₂ 8.5%, balance nitrogen
